Market Research — Bloom & Bare

Research scope

Brand: fictional beginner-friendly skincare/self-care startup
Market: initial planning assumption of India, with geography to be narrowed before a live campaign
Research type: desk-research framework and hypotheses; no primary survey/interviews or live competitor metric audit was conducted for this demo.

Category and audience observations

- Skincare information is abundant, but beginners may find routines and product terminology overwhelming.
- Educational content can build familiarity before asking for a purchase.
- Search engines serve active questions; social feeds are useful for visual explanations and community discussion.
- A free checklist is a low-friction way to test interest, but email signup alone does not prove purchase intent.
- Trust, privacy, transparent product information, and careful claims are essential.

Competitor benchmark framework

Competitor type	What to review	Potential learning
Established skincare brand	Ingredient pages, FAQs, education, email capture	How trust and expertise are communicated
DTC skincare startup	Landing pages, offer, social voice	How a concise proposition is presented
Skincare educator/creator	Reels, comments, audience questions	Which questions and formats resonate
Wellness newsletter	Lead magnet and welcome emails	How subscribers are nurtured

Do not insert assumed traffic, revenue, market-share, or conversion figures as facts. For a live report, record source URL, access date, and evidence for each competitor observation.

SWOT

Strengths: clear beginner focus; low-friction checklist offer; content can be repurposed across channels.
Weaknesses: fictional brand with no existing awareness, customer reviews, or validated product-market fit.
Opportunities: educational SEO, social saves/shares, permission-based email nurture, and creative testing.

Threats: crowded category, rising ad costs, platform changes, privacy requirements, and distrust of exaggerated skincare claims.

Recommended validation work

1. Interview 5–8 target users about routine confusion and content preferences.
2. Review search suggestions and keyword-tool data for the target region.
3. Audit 5–8 current competitors' landing pages, lead magnets, and public social content.
4. Test two ad hooks with a small controlled budget after analytics QA.
5. Review signup quality and subscriber feedback before scaling.
